

Human experimentation and NUNIX ethics

How do you develop a new technology that requires testing and the human brain while avoiding violations of the Hippocratic Oath by means of human testing? I feel a consent-based approach may work (similar to that of something like TMS therapy, but with many differences) although I am not entirely sure how this will work yet.

Violations of the Hippocratic Oath will not be tolerated. Human testing is currently not allowed, and the technology cannot continue until an alternative approach is found that is also ethical.
